

Sophos Phish Threat

Outlook add-in for Windows and Mac

Sophos Phish Threat Outlook add-in allows employees to report suspected phishing and spam messages with one click right, from Outlook. Available for Outlook for Windows and Mac, Outlook Web Access, Office 365, and Exchange environments, it turns all employees into an active line of defense against cyberattacks.

Highlights

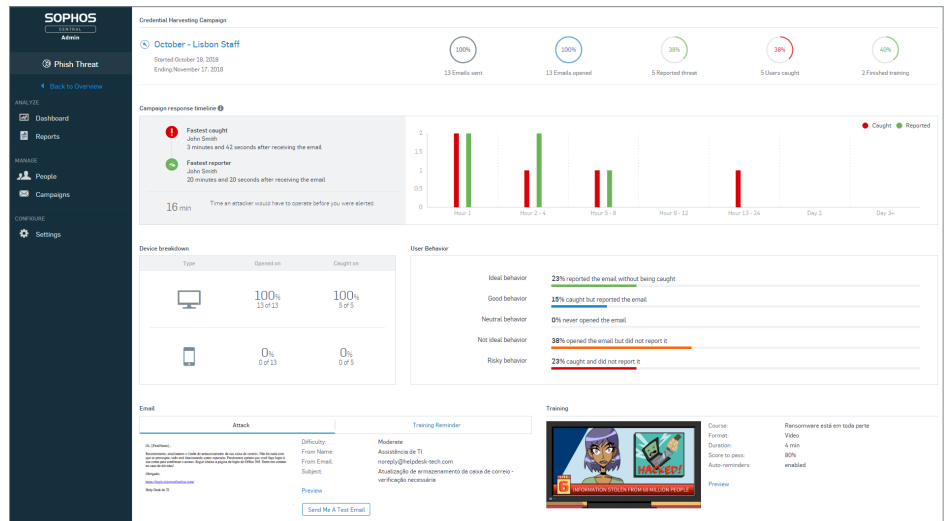

- ▶ Report suspected phishing and spam messages with one click
- ▶ Provide Instant feedback to employees
- ▶ Enrich existing Phish Threat Reports
- ▶ Compatible with Windows and Mac devices
- ▶ Works with O365 and Exchange Server environments

Benefits of Sophos Outlook add-in

Now with over 500 email threat templates and 60 engaging training modules in 10 languages, Phish Threat's single license already makes it simple to change employee behavior – existing customers see a 31% reduction in susceptibility to attacks in only four campaigns.

The Outlook add-in goes further to simplify the way employees report suspicious messages and simulated tests. With one click, users can report a message to the proper destination in the proper format and eliminate the need to remember a specific email address or how to properly forward unwanted messages.

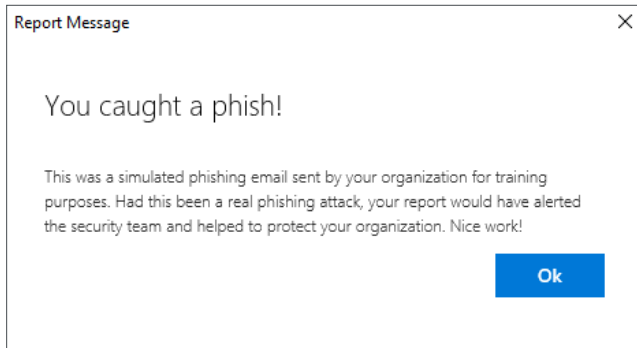

You and your team will get better visibility into organizational awareness of cybersecurity risks and the real threats you face. Phish Threat reports make it simple to view who, when, and on what device users receive their simulated attack – and who reported it.

Greater Visibility of Threats

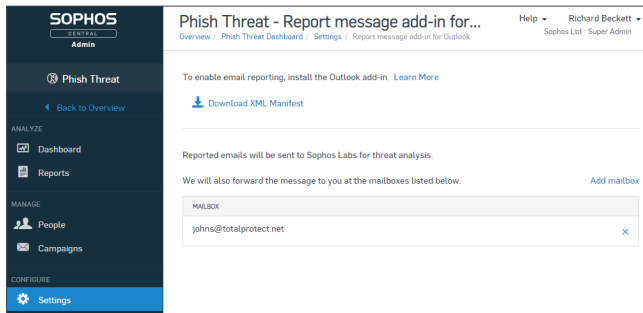

Instant feedback to employees is a terrific way of improving behavior. That's why any employee reporting a Phish Threat simulation will automatically receive an instant confirmation of the test.

Reports of all suspicious emails will be automatically forwarded to your designated Phish Threat inbox for greater visibility into the threats each organization faces. A copy will also be automatically sent to SophosLabs for further threat analysis, helping Sophos in its work to predict and prevent threats for all our customers.

Get Started

The Sophos Outlook add-in is included as standard with the Phish Threat license. Available to download today from Sophos Central and install to all devices centrally, you can soon start demonstrating how employee awareness is improving.

Compatibility

Sophos Phish Threat Outlook add-in is compatible with the following environments:

- ▶ Microsoft Office 365 Business subscription (Microsoft Exchange Online)
- ▶ Microsoft Exchange Server 2019 on-premises*

With support for a range of popular mail clients:

- ▶ Microsoft Outlook for Windows 2013, 2016, and 2019
- ▶ Microsoft Outlook for Mac 2016 and 2019
- ▶ Microsoft Outlook on the Web (Microsoft Office 365 or Outlook Web Access)

Installation

Whether running a proof-of-concept for Sophos Phish Threat or rolling out the service to thousands of employees, installation of the Outlook add-in is simple.

During proof of concept or testing, sideloading allows you to install the Sophos Outlook add-in on individual user devices via an XML Manifest file.

Centralized deployment is the best way to manage roll-out of Outlook add-in to all employees. Partners and customers can quickly and easily carry this out from the Office 365 Admin Center or using the Exchange Admin Center for on-premises estates. [Full details available here](#).

How to buy

Priced per user with bands from 1 to 5000+, Sophos Phish Threat's single license type keeps things simple, with unlimited tests per user, so you can focus on protecting your users – and business – safe from today's advanced phishing attacks.

*Microsoft Exchange 2013, 2016 for on-premises, and providers not listed are not currently supported.
